ASG TECH TIP

4 Tips To Extend The Life Of Your Laptop

The average battery life is just 3 to 4 hours from most laptop models—

Here are some tips to Extend the Life of your Battery ...

- 1 Power down all non-essential functions -Turn off your wireless card if you are no longer using it.
- 2 Stay out of extreme temperatures because they can drain your battery quickly.
- 3 Let your laptop do the saving—Most computers have a built-in ability to conserve battery life—Consult your computer user manual.
- 4 Always, always carry a spare battery because while these tips will help extend the life of your battery—they won't make them last forever.

ASG VIRUS UPDATE

Antivirus 360 is new rogue antispyware software that displays many fake warning alerts, messages and pop-ups. It will scan your computer and shows false scanning reports offers deleting malwares for \$50. Do NOT click on the pop ups!

What Are Viruses, Worms and Trojan Horses?

A Virus is a piece of computer code that attaches itself to a program or file so it can spread from computer to computer. It infects as it travels. Viruses can damage your software, your hardware, and your files.

A Worm, like a virus, is designed to copy itself from one computer to another, but it does so automatically. First, it takes control of features on the computer that can transport files or information. Once a worm is in your system, it can travel alone. A great danger of worms is their ability to replicate in great volume.

Trojan Horses are computer programs that appear to be useful software, but instead they compromise your security and cause a lot of damage. A Trojan horse can come in the form of an e-mail that included attachments that claimed to be Microsoft security updates, but turned out to be viruses that attempted to disable antivirus and firewall software.

MS Antivirus runs a scan on the computer and gives a false spyware report claiming that the computer is infected with spyware. This deceptive tactic is an attempt to scare the Internet user into clicking on the link or button to purchase MS Antivirus. This type of behavior can cause a computer to operate slower than normal.

SECURITY

What Is Your IT Network Security Risk?

- How is your data being stored? Are your backup devices being stored onsite and offsite? Do you have a secured password for those devices?
- Does your company have a security patch management policy to make sure all critical updates are being installed?
- Do your employees load screen savers and use other non-work related software on their computer such as instant messaging programs?
- Are your servers, workstations, and laptops have an up-to-date anti-virus program installed on them?
- Does your company network have a firewall with security detection on it?
- Does your company have an inventory of all software disks, manuals and license key codes stored in a secured location?

ASG Information Technologies can assist you with managing your IT network security risk.

COMPUTER FUNNIES

The day Microsoft makes something that doesn't suck

is probably the day they'll start making vacuum cleaners.

ASG TECH TIP
